Assignment2 - Troubleshooting

Script Functionality

This script is designed to automatically identify Sales Orders that need additional review and create a follow-up Task.

It checks three conditions:

1. High Sales Order total: The order amount exceeds a predefined review threshold.
2. Customer credit limit exceeded: The projected customer balance (existing balance plus the new order) exceeds the customer's credit limit.
3. Missing Customer PO Number: The Sales Order does not contain a customer purchase order number.

What happens when a condition is met?

- The script adds the reason for review to the Sales Order's standard Memo field.
- It creates a follow-up Task linked to that Sales Order.
- The Task is assigned to the user who is saving the Sales Order.

Note: The review threshold is configured in the NetSuite account's base currency.

Four Behavior Issues:

1. Threshold boundary: The rule says “just above 10,000,” but the script used >=. It now uses > so an order of exactly 10,000 does not trigger the threshold review.
2. Currency comparison: Sales Order total is in transaction currency, while the threshold and customer balance are compared in account base currency. The script now multiplies the order total by its exchange rate before checking the threshold and projected balance.
3. Missing PO check: The condition flagged orders that had a PO number. It now flags blank or whitespace-only PO numbers.
4. Duplicate follow-up Tasks: Every qualifying edit created another Task. The script now searches for the linked review Task and updates it with the current reasons and saving users instead of creating duplicates.

Assignment2 - Troubleshooting

Tested and created the task record on edit and save of the order in NetSuite Demo Account.
